# ICFP Programming Contest 2014 – Supermassive Black Hom-set Post-mortem

P. Lepin

## The Plan

- Implement the VM.
- Write a parser for a stand-alone HLL or implement an eDSL.
- Implement static checks and/or optimizations.
- Implement codegen.
- **⑤** ...?
- (end goal) Implement the Lambda-Man Al.

- Implement the VM. there was a web-based implementation
- Write a parser for a stand-alone HLL or implement an eDSL.
- Implement static checks and/or optimizations.
- Implement codegen.
- **⑤** ...?
- (end goal) Implement the Lambda-Man Al.

- Implement the VM. there was a web-based implementation
- Write a parser for a stand-alone HLL or implement an eDSL.
- Implement static checks and/or optimizations.
- Implement codegen.
- **⑤** ...?
- **6** (end goal) Implement the Lambda-Man Al.
- Implement symbolic labels on top of GHC assembly.
- **10 (end goal)** Implement a Ghost AI (or several).

- Implement the VM. there was a web-based implementation
- Write a parser for a stand-alone HLL or implement an eDSL.
- Implement static checks and/or optimizations.
- Implement codegen.
- **⑤** <del>...?</del>
- **(end goal)** Implement the Lambda-Man Al.
- Implement symbolic labels on top of GHC assembly.
- (end goal) Implement a Ghost AI (or several).
- ...some of these decisions were extremely myopic.

## Perceived Fun Factor

	Tools	ΑI
Lambda-Man	FUN!	FUN!
Ghosts	Less fun.	Less fun.

Lisp-machine CPU, compilers, fairly sophisticated Als – interesting. 8-bit CPUs and severely resource-constrained programs – not so much.

## Effort

	Tools	Al	
Lambda-Man	~ <b>9 hrs</b> , 205 sloc	~ <b>25 hrs</b> , 654 sloc, 3114	
		instructions compiled	
Ghosts	~ <b>3 hrs</b> , 259 sloc	~3 hrs, 91 instruction	

# Wild Guesstimate Of Impact

	Tools	ΑI
Lambda-Man	Some.	
Ghosts	HUGE!	

Judging by the results of home-brewed tournaments on reddit.

• HLL is Lisp-like, mimicking Scheme and Clojure.

Gory Details

# **HLL Compiler Targetting GCC**

• HLL is Lisp-like, mimicking Scheme and Clojure.

```
def foldl
        (fun [f init xs]
468
469
            (if [atom? xs]
470
471
                init
                 (recur f (f init (car xs)) (cdr xs))))
472 (def map-map (fun [f xs] (map (fun [x] (cons x (f x))) xs)))
473 (def map
474
        (fun [f xs]
475
            (if [atom? xs]
476
                NIL
477
                 (cons (f (car xs)) (map f (cdr xs)))))
```

Figure: Almost looks like the real thing.

- HLL is Lisp-like, mimicking Scheme and Clojure.
- Almost purely functional, set! is accepted by the parser, but...

- HLL is Lisp-like, mimicking Scheme and Clojure.
- Almost purely functional, set! is accepted by the parser, but...

```
221 cg n env labels (Spec "!1" [Lit x]) = ([Op "LD" [Num x, Num 1]], labels)
222 -- Unsupported: set!
223 cg n env labels expr = (unsafePerformIO $ hPutStrLn stderr $ "WARNING!!! Unable
```

Figure: Not really supported.

- HLL is Lisp-like, mimicking Scheme and Clojure.
- Almost purely functional, set! is accepted by the parser, but... is not supported.
- The only effectful part is do/debug.

- HLL is Lisp-like, mimicking Scheme and Clojure.
- Almost purely functional, set! is accepted by the parser, but... is not supported.
- The only effectful part is do/debug.
- Many quirks:

- HLL is Lisp-like, mimicking Scheme and Clojure.
- Almost purely functional, set! is accepted by the parser, but... is not supported.
- The only effectful part is do/debug.
- Many quirks:
  - No general TCE, explicit (and unchecked) tail recursion optimization using recur.

- HLL is Lisp-like, mimicking Scheme and Clojure.
- Almost purely functional, set! is accepted by the parser, but... is not supported.
- The only effectful part is do/debug.
- Many quirks:
  - No general TCE, explicit (and unchecked) tail recursion optimization using recur.
  - Mildly insane function call convention to support recur incompatible with ABI as in spec.

  - Built-ins such as car or + are special forms rather than first-class entities.
  - No macros.
  - Virtually no diagnostics or static checks a pain to debug.
- Implementing as eDSL could have given some type safety almost for free.

# HLL Compiler Targetting GCC – Bugs

 $\bullet$  A couple of nasty bugs ~30 hrs into the contest.

# HLL Compiler Targetting GCC – Bugs

• A couple of nasty bugs ~30 hrs into the contest.

```
212 212 cg n env labels (Spec "do" []) = ([], labels)

213 -cg n env labels (Spec "do" (expr : rest)) = (code' ++ code'', labels')

214 214 where

215 cg n env labels (Spec "do" (expr : rest)) = (code' ++ code'', labels')
```

Figure: The fact that it typechecks doesn't *always* mean it's correct. (But encoding the codegen in a monad *could* have helped.)

# HLL Compiler Targetting GCC - Bugs

• A couple of nasty bugs ~30 hrs into the contest.

```
212 212 cg n env labels (Spec "do" []) = ([], labels)

213 -cg n env labels (Spec "do" (expr : rest)) = (code' ++ code'', labels')

214 214 where

215 cg n env labels (Spec "do" (expr : rest)) = (code' ++ code'', labels')
```

Figure: The fact that it typechecks doesn't *always* mean it's correct. (But encoding the codegen in a monad *could* have helped.)

```
208 208 -- In general, never apply to unnamed functions: might be expensive
209 -- cg n env labels (Spec "recur" args) = [[Op "LD" [Num 0, Num 0]] ++ code' ++ [Op "LD" [Num 0,
209 +cg n env labels (Spec "recur" args) = ([Op "LD" ["$@recur" `var_lookup` (n, env))] ++ code'
210 210 where
```

Figure: recur only worked - occasionally - by accident.

- Lightning round AI retained as a fall-back main AI may not return a move in situations it considers hopeless:
  - Manhattan distance to the closest pill as a value function.
  - Doesn't like being too close to ghosts or visiting recently seen locations (reduces the effect of local minima).

## Lambda-Man Al

• Lightning round AI retained as a fall-back – main AI may not return a move in situations it considers hopeless:

- Manhattan distance to the closest pill as a value function.
- Doesn't like being too close to ghosts or visiting recently seen locations (reduces the
  effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.

#### Lambda-Man Al

 Lightning round Al retained as a fall-back – main Al may not return a move in situations it considers hopeless:

- Manhattan distance to the closest pill as a value function.
- Doesn't like being too close to ghosts or visiting recently seen locations (reduces the
  effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.
  - Being close to ghosts is penalized.

- Lightning round Al retained as a fall-back main Al may not return a move in situations it considers hopeless:
  - Manhattan distance to the closest pill as a value function.
  - Doesn't like being too close to ghosts or visiting recently seen locations (reduces the
    effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.
  - Being close to ghosts is penalized.
  - If nothing edible found, simple heuristic value function kicks in.

#### Lambda-Man Al

 Lightning round Al retained as a fall-back – main Al may not return a move in situations it considers hopeless:

- Manhattan distance to the closest pill as a value function.
- Doesn't like being too close to ghosts or visiting recently seen locations (reduces the
  effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.
  - Being close to ghosts is penalized.
  - If nothing edible found, simple heuristic value function kicks in.
  - Likes running towards nearest power pill when ghosts are nearby.

## Lambda-Man Al

 Lightning round Al retained as a fall-back – main Al may not return a move in situations it considers hopeless:

- Manhattan distance to the closest pill as a value function.
- Doesn't like being too close to ghosts or visiting recently seen locations (reduces the effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.
- Data structures: binary search trees (logarithmic access map and IntSet), simple queue from PFDS.

- Lightning round AI retained as a fall-back main AI may not return a move in situations it considers hopeless:
  - Manhattan distance to the closest pill as a value function.
  - Doesn't like being too close to ghosts or visiting recently seen locations (reduces the
    effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.
- Data structures: binary search trees (logarithmic access map and IntSet), simple queue from *PFDS*.

## Lambda-Man Al

 Lightning round Al retained as a fall-back – main Al may not return a move in situations it considers hopeless:

- Manhattan distance to the closest pill as a value function.
- Doesn't like being too close to ghosts or visiting recently seen locations (reduces the effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.
- Data structures: binary search trees (logarithmic access map and IntSet), simple queue from *PFDS*.
- Propagates ghosts (ignoring differences in speed) as long as they have no choice.

- Lightning round Al retained as a fall-back main Al may not return a move in situations it considers hopeless:

    effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.
- Data structures: binary search trees (logarithmic access map and IntSet), simple queue from *PFDS*.
- Propagates ghosts (ignoring differences in speed) as long as they have no choice.

Figure: After 2 steps.

## Lambda-Man Al

- Lightning round Al retained as a fall-back main Al may not return a move in situations it considers hopeless:
  - Manhattan distance to the closest pill as a value function.
  - Doesn't like being too close to ghosts or visiting recently seen locations (reduces the
    effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.
- Data structures: binary search trees (logarithmic access map and IntSet), simple queue from *PFDS*.
- Propagates ghosts (ignoring differences in speed) as long as they have no choice.

Figure: After 3 steps.

## Lambda-Man Al

- Lightning round Al retained as a fall-back main Al may not return a move in situations it considers hopeless:
  - Manhattan distance to the closest pill as a value function.
  - Doesn't like being too close to ghosts or visiting recently seen locations (reduces the
    effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.
- Data structures: binary search trees (logarithmic access map and IntSet), simple queue from *PFDS*.
- Propagates ghosts (ignoring differences in speed) as long as they have no choice.

Figure: After 4 or more steps.

## Lambda-Man Al

- Lightning round Al retained as a fall-back main Al may not return a move in situations it considers hopeless:
  - Manhattan distance to the closest pill as a value function.
  - Doesn't like being too close to ghosts or visiting recently seen locations (reduces the
    effect of local minima).
- BFS: cuts off on dying, reaching anything edible or exceeding the depth limit.
- Data structures: binary search trees (logarithmic access map and IntSet), simple queue from *PFDS*.
- Propagates ghosts (ignoring differences in speed) as long as they have no choice.
- Value of scared ghosts and fruits discounted by time to expiration.

## Lambda-Man Al – Quirks

• Termination of search on reaching anything edible leads to "interesting" behavior.

- Termination of search on reaching anything edible leads to "interesting" behavior.
- Scaredy Lambda-Man pessimistic estimates of ghost movement.

- Termination of search on reaching anything edible leads to "interesting" behavior.
- Scaredy Lambda-Man pessimistic estimates of ghost movement.
- Very little global preprocessing computing tunnels as graph edges was tempting.

- Termination of search on reaching anything edible leads to "interesting" behavior.
- Scaredy Lambda-Man pessimistic estimates of ghost movement.
- Very little global preprocessing computing tunnels as graph edges was tempting.
- Unnecessary map preprocessing on each step.

- Termination of search on reaching anything edible leads to "interesting" behavior.
- Scaredy Lambda-Man pessimistic estimates of ghost movement.
- Very little global preprocessing computing tunnels as graph edges was tempting.
- Unnecessary map preprocessing on each step.
- Al state fragile failures screw up future behavior.

- Termination of search on reaching anything edible leads to "interesting" behavior.
- Scaredy Lambda-Man pessimistic estimates of ghost movement.
- Very little global preprocessing computing tunnels as graph edges was tempting.
- Unnecessary map preprocessing on each step.
- Al state fragile failures screw up future behavior.
- Not-a-quirk: Ghost Als known, but emulation impractical due to cycle limit.

## Lambda-Man AI – Panic

• A few hours before the deadline...

## Lambda-Man AI – Panic

• A few hours before the deadline...

Figure: OMG!!! Cycle limit!

- A few hours before the deadline...
- Hard to estimate cycles spent sanely from inside the simulation.

- A few hours before the deadline...
- Hard to estimate cycles spent sanely from inside the simulation.
- Regretted not having my own VM web implementation sluggish and read-only.

```

Figure: Good luck editing this.

- A few hours before the deadline...
- Hard to estimate cycles spent sanely from inside the simulation.
- Regretted not having my own VM web implementation sluggish and read-only.
- Regretted not having macros no easy inlining.

- A few hours before the deadline...
- Hard to estimate cycles spent sanely from inside the simulation.
- Regretted not having my own VM web implementation sluggish and read-only.
- Regretted not having macros no easy inlining.
- Random BFS depth cutoffs based on the map size.

- A few hours before the deadline...
- Hard to estimate cycles spent sanely from inside the simulation.
- Regretted not having my own VM web implementation sluggish and read-only.
- Regretted not having macros no easy inlining.
- Random BFS depth cutoffs based on the map size.
- Optimized by hand.

- A few hours before the deadline...
- Hard to estimate cycles spent sanely from inside the simulation.
- Regretted not having my own VM web implementation sluggish and read-only.
- Regretted not having macros no easy inlining.
- Random BFS depth cutoffs based on the map size.
- Optimized by hand.
  - Non-tail recursive list HOFs no artifical limitations on stack depth, RTNs are cheaper than reversing the accumulator.

```
73 (def map
74 (fun [f xs]
75 (if [atom? xs]
76 NIL
77 (cons (f (car xs)) (map f (cdr xs)))))
78 ;(def map (fun [f xs] (reverse (map-rev NIL f xs))))
79 ;(def map-rev
80 ; (fun [acc f xs]
81 ; (if [atom? xs]
82 ; acc
83 : (recur (cons (f (car xs)) acc) f (cdr xs)))))
```

  - Fused maps and filters in a few places.
  - Eliminated some unneeded intermediate variables.
- Seems to have worked.

## Ghost AI

• *Very* limited resources – even accounting for no need to make decisions on most runs.

• Wanted something simple and reasonably robust.

- Wanted something simple and reasonably robust.
- Tries to minimize  $L_1$  distance to Lambda-Man (*Blinky/Chaser*-style).

- Wanted something simple and reasonably robust.
- Tries to minimize  $L_1$  distance to Lambda-Man (*Blinky/Chaser*-style).
  - Problem: Ghosts tend to clump together.

- Wanted something simple and reasonably robust.
- Tries to minimize  $L_1$  distance to Lambda-Man (*Blinky/Chaser*-style).
  - Problem: Ghosts tend to clump together.
  - Problem: Can get stuck in dead ends easily.

- *Very* limited resources even accounting for no need to make decisions on most runs.
- Wanted something simple and reasonably robust.
- Tries to minimize  $L_1$  distance to Lambda-Man (*Blinky/Chaser*-style).
- Ghost's index affects tie-breaks: different ghosts favour different directions at intersections.

- Wanted something simple and reasonably robust.
- Tries to minimize  $L_1$  distance to Lambda-Man (*Blinky/Chaser*-style).
- Ghost's index affects tie-breaks: different ghosts favour different directions at intersections.
- Simple counter: after a few actual decisions in a row resulting in horizontal or vertical move, that axis is excluded.

- Very limited resources even accounting for no need to make decisions on most runs.
- Wanted something simple and reasonably robust.
- Tries to minimize  $L_1$  distance to Lambda-Man (*Blinky/Chaser*-style).
- Ghost's index affects tie-breaks: different ghosts favour different directions at intersections.
- Simple counter: after a few actual decisions in a row resulting in horizontal or vertical move, that axis is excluded.
- Pretty efficient on non-pathological maps: ghosts tend to surround the Lambda-Man.
